Our technology, both for GTL and hydrogen production applications, has been developed over many years.

Throughout the development programme, the identification and protection of all the associated IP has been rigorous. We benefit from world class IP consultants, patent attorneys and lawyers, and adopt a robust approach to IP protection and infringement prevention worldwide. CompactGTL has expansive patent families granted in a wide range of jurisdictions, with further patent applications pending and under development.

As CompactGTL continues to develop its technology alongside international strategic partners, and prepares to deliver oilfield solutions globally, the management and defence of our strong IP portfolio remains a top priority for the business.
