CompactGTL's specific focus is on a variety of field types:

- **Fields producing 10 - 50 MMscf per day**
- **Fields with reserves of up to 250 MMBO and gas reserves of up to 300 BCF**
- **Fields where flaring is being phased out or heavily taxed**
- **New fields where re-injection is not viable because of the low volume of associated gas, the distance to market, a lack of on-shore solutions (such as LNG and methanol) and the location of reservoirs**
- **New fields where re-injection is the only viable option but results in significant capital cost, increased complexity of reservoir management, potential damage to the reservoir and limits on oil production rates**
